Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Aruffo A., Stamenkovic I., Melnick M., Underhill C.B., Seed B.;
"CD44 is the principal cell surface receptor for hyaluronate.";
Cell 61:1303-1313(1990).
-!- FUNCTION: Main cell surface receptor for hyaluronate. Adhesion to
mucosal high endothelial venule and to types I and VI collagen.
Probably involved in matrix adhesion, lymphocyte activation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lymph node homing.

-- SUBCELLULAR LOCATION: Type I membrane protein.

-- INDUCTION: By EBV.

-- PTM: Extensively modified including N- and O-linked glycosylation, addition of the glycosaminoglycan chondroitin sulfate, of sulfate, of phosphate to cytoplasmic domain serine residues.

-- SIMILARITY: Contains I link domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-OCT-1996 (Rel. 34, Last sequence update)
15-WAR-2004 (Rel. 43, Last annotation update)
CD44 antigen precursor (Phagocytic glycoprotein I) (PGP-1) (HUTCH-I)
(Extracellular matrix receptor-III) (ECMR-III) (GP90 lymphocyte
homing/adhesion receptor) (Hermes antigen) (Hyaluronate receptor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa, Chordata, Craniata; Vertebrata, Euteleostomi,

                                                                                                                                                                              Name=1; Synonyms=Short;

Isold=P26051-2; Sequence=VSP 005330;

PTM: N-glycosylated (By similarity).

PTM: O-glycosylated; contains chondrolitin sulfate glycans which

can be more or less sulfated (By similarity).

PTM: Phosphorylated; activation of PKC results in the

dephosphorylation of Ser-467 (constitutive phosphorylation site),

and the phosphorylation of Ser-467 (constitutive phosphorylation site),

SIMILARITY: Contains 1 link domain.
                                                       mucosal high endothelial venule and to types I and Vi collagen. Probably involved in matrix adhesion, lymphocyte activation and lymph node howing.

SUBCELLULAR LOCATION: Type I membrane protein.

SIGNAL
                                                             lymph node homing.

SUBCELLULAR LOCATION: Type I membrane protein.

SUBCELLULAR LOCATION: Type I membrane protein.

Addition of the glycosaminoglycan chondroitin sulfate, of sulfate, of phosphate to cytoplasmic domain serine residues.

SIMILARITY: Contains I link domain.
FUNCTION: Main cell surface receptor for hyaluronate. Adhesion to
                  mucosal high endothelial venule and to types I and VI collagen. Probably involved in matrix adhesion, lymphocyte activation and

```
And a blood group-related polymorphism of CD44 abolishes a hyaluronan-
RT binding consensus sequence without preventing hyaluronan binding.";

Biol. Chem. 271:147-7153 (1996).

E biol. Chem. 271:147-7153 (1996).

CC --- FUNCTION: Receptor for hyaluronic acid (HA). Mediates cell-cell
and ocell-matrix interactions through its affinity for HA, and
possibly also through its affinity for other ligands such as
cc osteopontin, collagens, and matrix matalloproteinases (MMPS).

CC osteopontin, collagens, and matrix matalloproteinases (MMPS).

CC recirculation and homing, and in hematopoiesis. Altered expression
or dysfunction causes numerous pathogenic phenotypes. Grace
protein heterogeneity due to numerous alternative splicing and
cc protein heterogeneity due to numerous alternative splicing and
cc protein heterogeneity and in hematogenic phenotypes. Grace
collagen, laminh, and fibronectin via its N-Cerminal segment.

CC --- SUBUNIT: Interacts with HA, as well as other glycosaminoglycans,
collagen, laminh, and fibronectin via its N-Cerminal segment.

MSN), and NF2 via its C-terminal segment.

CC --- SUBCELLULAR LOCATION: Type I membrane protein.

ted (By similarity).

ted; contains chondroitin sulfate glycans which ess sulfated (By similarity).

ted; activation of PKC results in the n of Ser-395 (constitutive phosphorylation site), ylation of Ser-361 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        , Last sequence update)

Immunol. 28:1131-1135(1991).

-!- FUNCTION: Main cell surface receptor for hyaluronate. Adhesion to mucosal high endothelial venule and to types I and VI collagen.

Probably involved in matrix adhesion, lymphocyte activation and lymph node homing.
-!- SUBSCELLULAR LOCATION: Type I membrane protein.
-!- TISSUB SPECIFICITY: Mesenteric lymph node and liver, not in heart.
-!- PIN: Extensively modified including N- and O-linked glycosylation,
                                                                                             LysLysGlyGluTyrArgThrHisGlnGluAspileAspAlaSerAsnIleIleAspAsp

             PTM: N-glycosylated (By similarity).
PTM: 0-glycosylated; contains chondroitin sulfate glycans which can be more or less sulfated (by similarity).
PTM: Phosphorylated, cativation of PKC results in the dephosphorylation of Ser-742 (constitutive phosphorylation site), and the phosphorylation of Ser-708 (by similarity).
POLYMORPHISM: Two allelic forms of this glycoprotein, PGP-1.1 and PGP-1.2, have been reported. The expressed product is PGP-1.1 (Ly-

Milde K.F., Alejandro R., Mintz D.H., Pastori R.L.;

Elophim. Biophys. Acta 1218:112-114(1994).

L. FUNCTION: Main cell surface receptor for hyaluronate. Adhesion to mucosal high endothelial venule and to types I and VI collagen.

Probably involved in matrix adhesion, lymphocyte activation and lymph node homing.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

C.!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- TISSUE SPECIFICITY: Lymph nodes.

-!- FTM: Extensively modified including N- and O-linked glycosylation, addition of the glycosaminoglycan chondroitin sulfate, of sulfate, of plasmic domain serine residues (By

                    lymph node homing.
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- PTM: Extensively modified including N- and O-linked glycosylation, addition of the glycosaminoglycan chondroitin sulfate, of sulfate, of phosphate to cytoplasmic domain serine residues.
--- SIMILARITY: Contains 1 link domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Glycoprotein; Phosphorylation; Receptor;

DOMAIN: Two globular domains, G1 and G2, comprise the amino maken up the COOH terminus of the proteoglycan, while another globular region, G3, makes up the COOH terminus G1 contains link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, C motifs. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2 and G3.
                                                                                                                                                                                                                                                                                      MEDLINE=98209637; PubMed=9550267; Plannery C.R., Little C.B., Caterson B.; Plannery C.R., Little C.B., Caterson B.; Molecular cloning and sequence analysis of the aggrecan interglobular domain from porcine, equine, bowine and owine cartilage: comparison of proteinase-susceptible regions and sites of keratan sulfate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: Contains mostly chondroitin sulfate, but also keratan sulfate chains, N-linked and O-linked oligosaccharides (By similarity). SIMILARITY: Belongs to the aggrecan/versican proteoglycan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i- FUNCTION: This proteoglyon is a major component of extracellular matrix of cartilagenous tissues. A major function of this protein is to resist compression in cartilage. It binds avidly to hyaluronic acid via an amino-terminal globular region. May play a regulatory role in the matrix assembly of the cartilage.
-i- SUBCELLULAR LOCATION: Secreted; extracellular matrix (By

Gl contains link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, B' motifs. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2
                                    matrix of cartilagenous tissues. A major function of this protein
FUNCTION: This proteoglycan is a major component of extracellular
                                                                                        is to resist compression in cartilage. It binds avidly to hyaluzonic acid via an amino-terminal globular region. May play regulatory role in the matrix assembly of the cartilage. SUBCELLUIAR LOCATION: Secreted; extracellular matrix (By
                                                                                                                                                                                                                                                                                                                                                                                               Event=Alternative splicing; Named isoforms=2;
